In Today's Class You Will...

- Create a JavaScript file and include it in an HTML file
- Create *comments* in JavaScript
- Use *variables* to store and retrieve values
- Use *operators* to modify values

Part 1: Programming Fundamentals

Solving Problems Like a Programmer

1. Create steps
   - break the solution down into ordered steps.
2. Understand constraints.
   - Identify the specific requirements in addition to the original problem

Constraints/Requirements

Its all magic.

JavaScript

- Internet's favourite programming language.
- Most popular scripting language and works on all major browsers.
- Scripting language is a lightweight programming language but very powerful.
- It was designed to add interactivity to web pages.
- Except for certain specialized libraries, JavaScript occurs entirely on the client, and not the server.
- JavaScript has nothing to do with Java.

JavaScript's Three Tiers of Awesome!!!

1. Comes with pre-built "magic" words.

2. Lets you make your own "magic" words (functions).

3. There are libraries of "magic" words that others have built that you can use. (e.g. jQuery)

Client-side JavaScript

- JavaScript can be run from 3 different points: inline, internal and external.
  - **Inline** – is insert a snippet of JavaScript code into html code for execute immediately when it is encountered.
  - **Internal** – is providing a section within the header of the html file where declarations and functions are called within the html file itself.
  - **External** – is providing a separate file that contains all JavaScript functions and declarations and is referred to by the html file through a reference link.
